# Stepper Motor Theory

**Motors convert electrical energy into mechanical energy. A stepper motor converts electrical pulses into specific rotational movements. The movement created by each pulse is precise and repeatable, which is why stepper motors are so effective for positioning applications.**

Permanent Magnet stepper motors incorporate a permanent magnet rotor, coil windings and magnetically conductive stators. Energizing a coil winding creates an electromagnetic field with a north and south pole as shown in figure. The stator carries the magnetic field. The magnetic field can be altered by sequentially energizing or "stepping" the stator coils which generates rotary motion.

Figure 1 illustrates a typical step sequence for a two phase motor. In Step 1 phase A of a two phase stator is energized. This magnetically locks the rotor in the position shown, since unlike poles attract, when phase A is turned off and phase B is turned on, the rotor rotates 90° clockwise. In step 3, phase B is turned on but with the polarity reversed from Step 1, this causes another 90° rotation. In Step 4, phase A is turned off and phase B is turned on, with polarity reversed from Step 2. Repeating this sequence causes the rotor to rotate clockwise in 90° steps.

The stepping sequence illustrated in figure 1 is called "one phase on" stepping. A more common method of stepping is "two phase on" where both phases of the motor are always energized. However, only the polarity of phase is switched at a time, as shown in figure 2. With two phase on stepping the rotor aligns itself between the "average" north and "average" south magnetic poles. Since both phases are always on, this method gives 41.4% more torque than "one phase on" stepping.

Figure 1

Figure 2

## Half Stepping

The motor can also be "half stepped" by inserting an off state between transitioning phases. This cuts a stepper's full step angle in half. For example, a 90° stepping motor would move 45° on each half step, figure 3. However, half stepping typically results in a 15%-30% loss of torque depending on step rate when compared to the two phase on stepping sequence. Since one of the windings is not energized during each alternating half step there is less electromagnetic force exerted on the rotor resulting in a net loss of torque.

Figure 3 - Half-stepping-90° step angle is reduced to 45° with half-stepping.

## DC Brush Motor

### Principles of operation

The differences between a DC motor having a mechanical commutation system and a BLDC motor are mainly found in :

- the product concept
- the commutation of phase currents.

From the user's point of view, brushless DC motors follow the same equations as those with brushes: torque is proportional to current, speed depends on the voltage and the load torque.

The commutation of brushless motors

In the conventional DC motor commutation takes place mechanically through the commutator-and-brush system. In a BLDC motor, commutation is done by electronic means. In that case the instantaneous rotor position must be known in order to determine the phases to be energized.

The angular rotor position can be known by:

- using a position sensor (Hall sensor, optical encoder, resolver)
- electronically analyzing the back-EMF of a non-energised winding. This is called sensorless commutation.

Use of Hall sensors

In general, BLDC motor have three phase windings. The easiest way is to power two of them at a time, using Hall sensors to know the rotor position. A simple logic allows for optimal energizing of the phases as a function of rotor position, just like the commutator and brushes are doing in the conventional DC motor.

Use of an encoder or resolver

The rotor position may also be known by use of an encoder or resolver. Commutation may be done very simply, similar to the procedure with Hall sensors, or it may be more complex by modulating sinusoidal currents in the three phases. This is called vector control, and its advantage is to provide a torque ripple of theoretically zero, as well as a high resolution for precise positioning.

Use of Back-EMF analysis

A third option requiring no position sensor is the use of a particular electronic circuit. The motor has only three hook-up wires, the three phase windings are connected in either triangle or star. In the latter case, resistors must be used to generate a zero reference voltage. With this solution the motor includes no sensors or electronic components and it is therefore highly insensitive to hostile environments. For applications such as hand-held tools, where the cable is constantly moved, the fact of just three wires is another advantage.

The functioning of a sensorless motor is easy to understand. In all motors, the relation of back-EMF and torque versus rotor position is the same. Zero crossing of the voltage induced in the non-energised winding corresponds to the position of maximum torque generated by the two energized phases. This point of zero crossing therefore allows to determine the moment when the following commutation should take place depending on motor speed. This time interval is in fact equivalent to the time the motor takes to move from the position of the preceding commutation to the back-EMF zero crossing position. Electronic circuits designed for this commutation function allow for easy operation of sensorless motors.

As the back-EMF information is necessary to know the rotor position, sensorless commutation doesn't work with the motor at stall. The only way of starting is to pilot it at low speed like a stepper in open loop.

Remember:

- for commutation, position sensors are necessary when operating in incremental mode
- sensorless commutation is recommended only for applications running at constant speed and load.

Operating principle of BLDC motors:

It follows the same equations as the DC motor using mechanical commutation except that parameters like iron losses and losses in the drive circuit are no longer negligible in applications where efficiency is of prime importance.

Iron losses

They depend on speed and, in the torque formula, may be introduced as viscous friction. The equation for useful motor torque becomes:

$$M_m = k \cdot I_m - k_v \cdot \omega - M_f$$

With  $M_m$  = motor useful torque

$k$  = torque constant

$I_m$  = motor current

$k_v$  = viscous coefficient for iron losses

$\omega$  = angular velocity

$M_f$  = bearing friction

Losses in the electronics

The current and voltage required by the motor and the drive circuit to operated at the desired speed and torque depend also on the drive circuit.

As an example, a driver bridge in bipolar technique will reduce the voltage available at the motor terminals by about 1.7V, and the total current must include the consumption of the circuitry.

## Small Brushless DC Motor

### Principles of operation

The differences between a DC motor having a mechanical commutation system and a BLDC motor are mainly found in :

- the product concept
- the commutation of phase currents.

From the user's point of view, brushless DC motors follow the same equations as those with brushes: torque is proportional to current, speed depends on the voltage and the load torque.

### The commutation of brushless motors

In the conventional DC motor commutation takes place mechanically through the commutator-and-brush system. In a BLDC motor, commutation is done by electronic means. In that case the instantaneous rotor position must be known in order to determine the phases to be energized. The angular rotor position can be known by:

- using a position sensor (Hall sensor, optical encoder, resolver)
- electronically analyzing the back-EMF of a non-energised winding. This is called sensorless commutation.

### Use of Hall sensors

In general, BLDC motor have three phase windings. The easiest way is to power two of them at a time, using Hall sensors to know the rotor position. A simple logic allows for optimal energizing of the phases as a function of rotor position, just like the commutator and brushes are doing in the conventional DC motor.

### Use of an encoder or resolver

The rotor position may also be known by use of an encoder or resolver. Commutation may be done very simply, similar to the procedure with Hall sensors, or it may be more complex by modulating sinusoidal currents in the three phases. This is called vector control, and its advantage is to provide a torque ripple of theoretically zero, as well as a high resolution for precise positioning.

### Use of Back-EMF analysis

A third option requiring no position sensor is the use of a particular electronic circuit. The motor has only three hook-up wires, the three phase windings are connected in either triangle or star. In the latter case, resistors must be used to generate a zero reference voltage. With this solution the motor includes no sensors or electronic components and it is therefore highly insensitive to hostile environments. For applications such as hand-held tools, where the cable is constantly moved, the fact of just three wires is another advantage.

The functioning of a sensorless motor is easy to understand. In all motors, the relation of back-EMF and torque versus rotor position is the same. Zero crossing of the voltage induced in the non-energised winding corresponds to the position of maximum torque generated by the two energized phases. This point of zero crossing therefore allows to determine the moment when the following commutation should take place depending on motor speed. This time interval is in fact equivalent to the time the motor takes to move from the position of the preceding commutation to the back-EMF zero crossing position. Electronic circuits designed for this commutation function allow for easy operation of sensorless motors. As the back-EMF information is necessary to know the rotor position, sensorless commutation doesn't work with the motor at stall. The only way of starting is to pilot it at low speed like a stepper in open loop.

### Remember:

## 3.6° Size 42mm Hybrid Stepping Motor

### General Specification Hybrid Stepping Motor

Item	Specifications
Step Angle	3.6°
Step Angle Accuracy	±5% (full step, no load)
Resistance Accuracy	±10%
Inductance Accuracy	±20%
Temperature Rise	80°C Max. (rated current, 2 phase on)
Ambient Temperature	-20°C~+50°C
Insulation Resistance	100MΩMin. ,500VDC
Dielectric Strength	500VAC for one minute
Shaft Radial Play	0.02Max. (450 g-load)
Shaft Axial Play	0.08Max. (450 g-load)
Max. radial force	28N (20mm from the flange)
Max. axial force	10N

# Brushless DC Motor

## ● Specification for Brushless DC Motor

Item	Specifications
Winding type	Star
Hall effect angle	120 degree electrical angle
Shaft run out	0.025 mm
Radial play	0.02 mm @ 450 g
End play	0.08 mm @ 450 g
Max. radial force	15 N @ 10 mm from the flange
Max. axial force	10 N
Insulation class	Class B
Dielectric strength	500 Vdc for one minute
Insulation resistance	100MΩ Min., 500 Vdc

# SlimLine Series Drivers

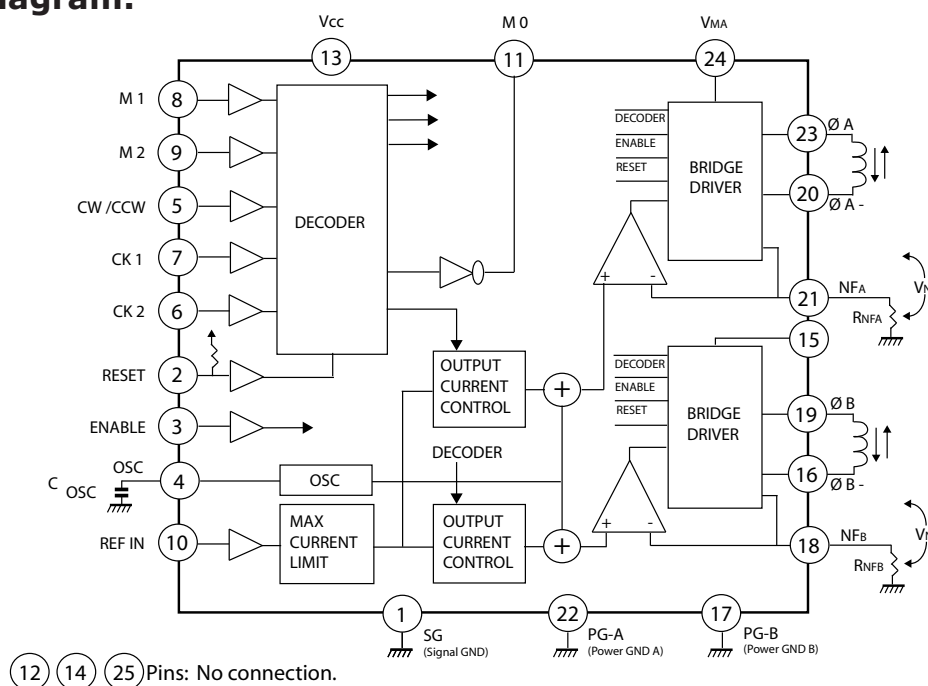

## ● SDI-C403 IC drive

### Main features and specifications:

- Bipolar PWM chopper drive;
- Chopper frequency 20 to 40 kHz;
- Phase current 1.5 Arms (2.5 Apeak);
- Maximum Output Voltage 40 Vdc;
- Step angle: full step, 1/2 step, 1/4 step, 1/8 step;
- Inputs: step, direction, drive enable, current reduction (CMOS type with integrated 40 Kohm pull-up resistors);
- Output: drive status monitor ( ±2 mA max.);
- Package: CPP - 25 pins ( 25 W );
- Power supply: PWM 24 Vdc ( 40 Vdc max ); logic 5 Vdc ±10%;
- Operating temperature : - 40° ÷ + 85° C.

### Block diagram:

### Mechanical drawing and dimensions:

## SlimLine Series Drivers

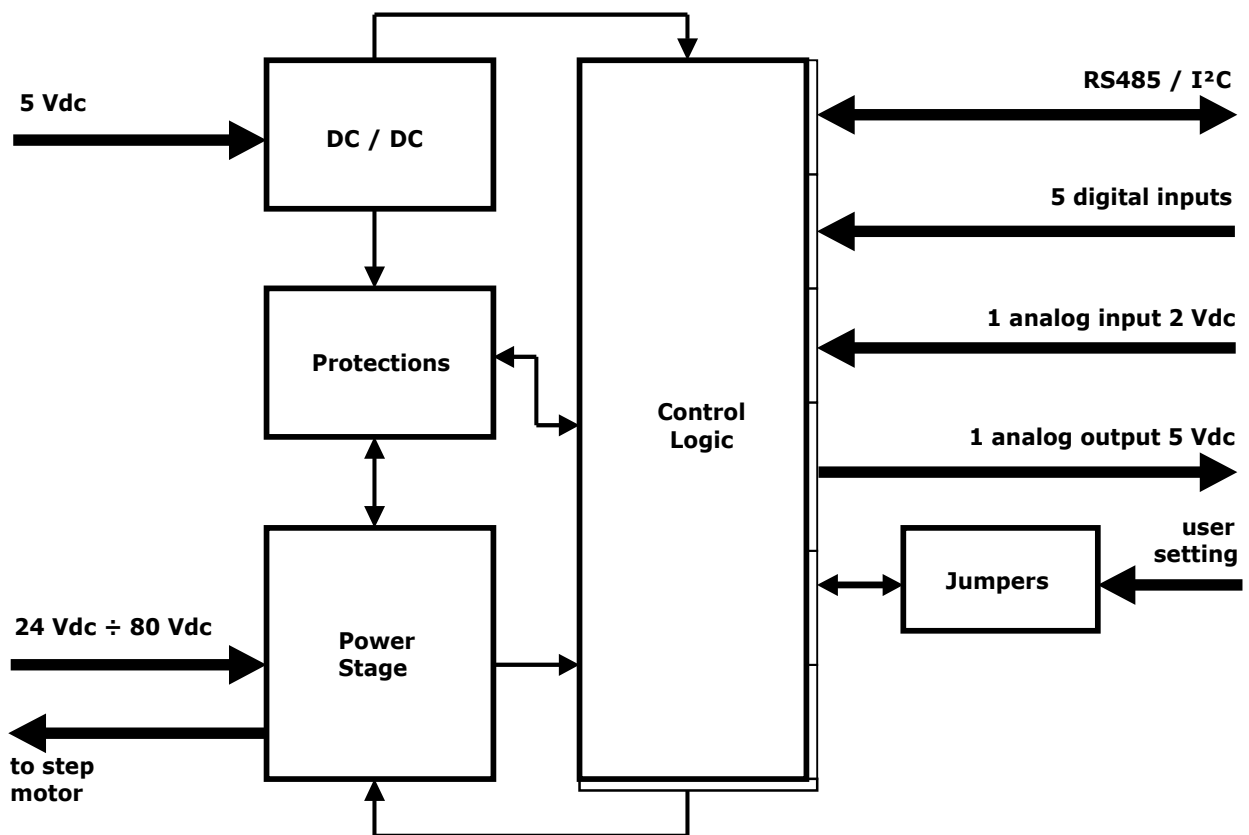

- **M5A stepper drive**

**Main features and specifications:**

- motor movement control by step /dir operation or internal clock;
- 24 to 80 Vdc power stage;
- 5 Vdc logical stage;
- step angle: full step, 1/2 step, 1/4 step, 1/8 step with sinusoidal envelopes;
- phase current: 6.0 Apeak;
- protection against over- and under-voltage, over-current and overtemperature;
- 5 digital inputs, 1 analogue input and 1 analogue output;
- serial asynchronous RS485 or synchronous I<sup>2</sup>C bus interface;
- jumpers to select between internal/external step control and RS485/I<sup>2</sup>C bus.

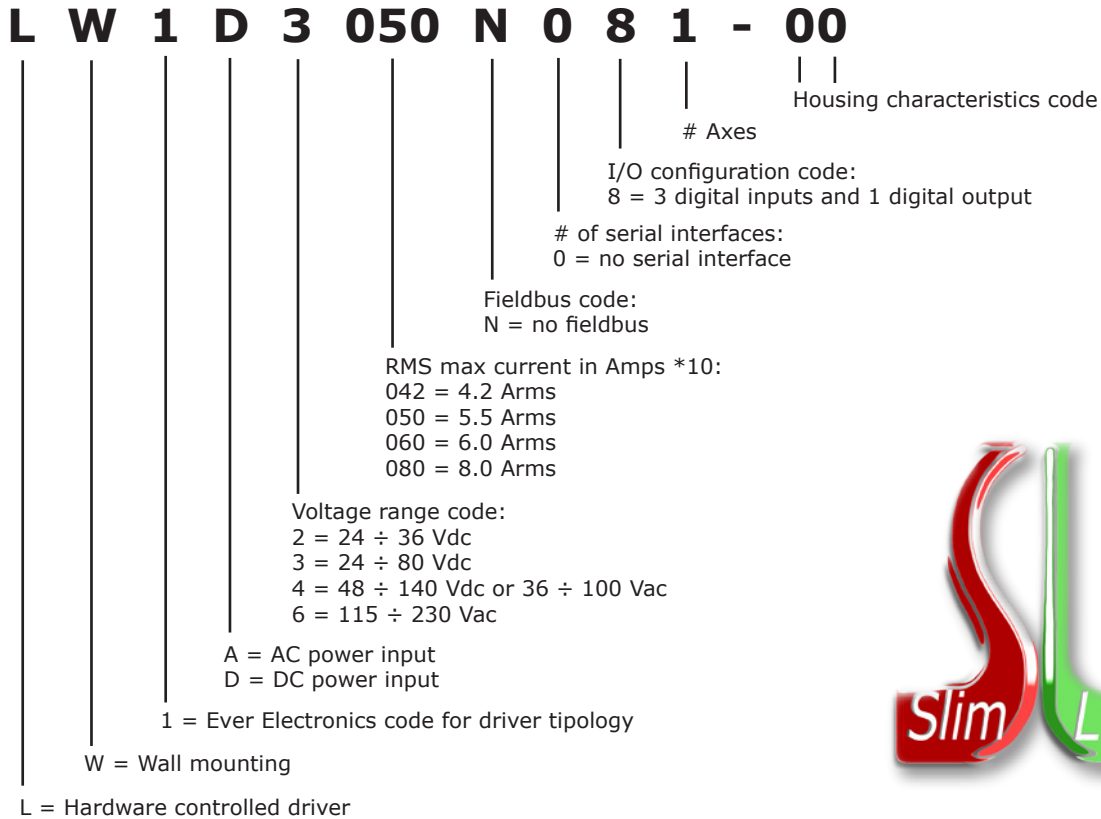

**Block diagram:**

# SlimLine Series Drivers

## • LW1 Series

### Product number code for SlimLine series driver

### Main features:

The LW drives are mastered by means of hardware settings (dip-switches), step & direction, analogue speed reference or start/stop inputs.

All models performs:

- On Board Safety provisions:
  - ✓ fully tested for direct installation unit
  - ✓ fault monitoring and handling
- Other features:
 

<ul style="list-style-type: none"> <li>✓ low motor vibration</li> <li>✓ low mechanical noise</li> <li>✓ no resonance</li> <li>✓ excellent EMC propriety</li> <li>✓ safe protections</li> <li>✓ high speed and torque output</li> </ul>	<ul style="list-style-type: none"> <li>✓ compact sizes</li> <li>✓ low heat generation</li> <li>✓ high reliability</li> <li>✓ easy setup</li> <li>✓ DC/AC Power Supply</li> <li>✓ wide range of power</li> </ul>
--	---

## SlimLine Series Drives

### • LW1 Series

#### Models specifications:

#### LW1D2042N081-00

- supply voltage 24 ÷ 36 Vdc;
- step angle till 1/256 and 1/250 with sinusoidal envelopes;
- output phase current controllable from 1.5 to 4.2 Arms;
- 3 300kHz, 5V PNP or NPN or line-driver optoisolated inputs for clock, direction and enable;
- 1 24Vdc-500mA fault protected output;
- automatic reduction of the idle current;
- dimensions 100.0 x 74.0 x 37.0 mm.

#### LW1D3050N081-00

- supply voltage from 24 to 80 Vdc;
- step angle till 1/256 and 1/250 with sinusoidal envelopes;
- output phase current controllable from 1.0 to 5.5 Arms;
- 3 300kHz, 5V PNP or NPN or line-driver optoisolated inputs for clock, direction and enable;
- 1 24Vdc-500mA fault protected output;
- automatic reduction of the idle current;
- dimensions 120.0 x 97.5 x 45.5 mm.

#### LW1A9060N081-00

- supply voltage from 115 to 230 Vac;
- step angle till 1/256 and 1/250 with sinusoidal envelopes;
- output phase current controllable from 1.0 to 6.0 Arms;
- 3 300kHz, 5V PNP or NPN or line-driver optoisolated inputs for clock, direction and enable;
- 1 24Vdc-500mA fault protected output;
- automatic reduction of the idle current.
- dimensions 120 x 97.5 x 45.5 mm

#### Control modes:

- Step & Direction Mode

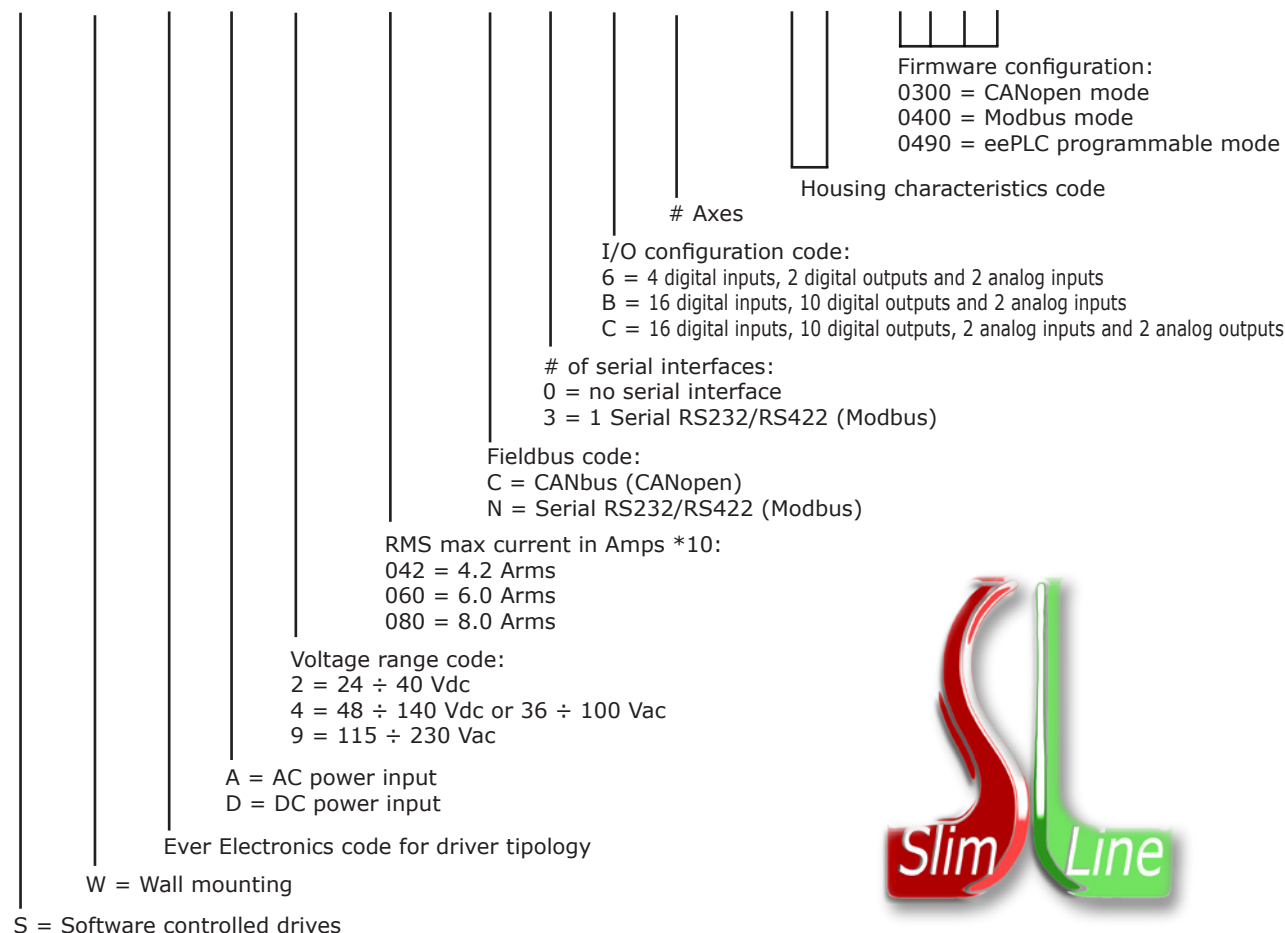

## SlimLine Series Drives

### ● SW1 Series

Product number code for SlimLine series drives

**S W 1 A 4 080 C 0 6 1 - 00 c0300**

### Main features:

The SW drives communicate through serial interfaces and/or fieldbus and are configured by means of software interfaces for Microsoft Windows OS.

All models performs:

- Multifunction Control Modes
- On Board Safety provisions:
  - ✓ fully tested for direct installation unit
  - ✓ built in watch dog functionality
  - ✓ fault monitoring and handling
  - ✓ on field working errors buffering
- Other features:
 

<ul style="list-style-type: none"> <li>✓ low motor vibration</li> <li>✓ low mech. noise</li> <li>✓ no resonance</li> <li>✓ safe protections</li> <li>✓ DC/AC Power Supply</li> </ul>	<ul style="list-style-type: none"> <li>✓ compact sizes</li> <li>✓ low heat generation</li> <li>✓ high reliability</li> <li>✓ high speed and torque output</li> <li>✓ wide range of power</li> </ul>

# SlimLine Series Drives

## ● SW1 Series

### Models specifications:

#### SW1D2042C061-00 / SW1D2042N361-00

- supply voltage 24 ÷ 40 Vdc;
- phase current from 0.2 to 4.2 Arms (0.3 to 6.0 Apeak);
- step angle: from full step to 1/128 with sinusoidal envelopes;
- CANBus (Canopen) or serial interface RS232/RS422 (Modbus);
- 4 digital optoisolated inputs and 2 digital optoisolated outputs;
- 2 analog inputs ±10V;
- dimensions 142.0 x 74.0 x 37.0 mm

#### SW1D4080C061-00 / SW1A4080C061-00

#### SW1D4080N361-00 / SW1A4080N361-00

#### SW1D4080N3B1-00 / SW1A4080N3B1-00

- supply voltage from 48 to 140 Vdc or 36 ÷ 100 Vac, separated for logic and power;
- phase current from 1.0 to 8.0 Arms (1.40 to 11.28 Apeak);
- step angle: from full step to 1/128 with sinusoidal envelopes;
- CANBus (Canopen) or serial interface RS232/RS422 (Modbus);
- 4 digital optoisolated inputs and 2 digital optoisolated outputs or 16 digital optoisolated inputs and 10 digital optoisolated outputs;
- 2 analog inputs ±10V;
- dimensions 165.0 x 97.5 x 62.3 (54.3 for SW1D4080\_\_61-00) mm

#### SW1A9060C061-00 / SW1A9060N361-00

#### SW1A9060N3C1-00

- supply voltage from 115 to 230 Vac;
- phase current from 1.0 to 6.0 Arms (1.40 to 8.46 Apeak);
- step angle: from full step to 1/128 with sinusoidal envelopes;
- CANBus (Canopen) or serial interface RS232/RS422 (Modbus);
- 4 digital optoisolated inputs and 4 digital optoisolated outputs or 16 digital optoisolated inputs and 10 digital optoisolated outputs;
- 2 analog inputs ±10V;
- 2 analog outputs (SW1A9060N3C1-00 only)
- dimensions 235.0 x 151.5 x 62.5 mm

### Motion module:

- Step & Direction control mode;
- Analog speed ref. control mode (by potentiometer or ±10Vdc);
- Velocity control mode;
- Wide range of positioning control modes (homing, relative, absolute, target);
- CAM mode: cam profile can be programmed;
- Electric Gear with programmable gear ratio to track external master reference (from fieldbus or incremental encoder) of motor's speed and position;
- High speed I/O triggered motor's start & stop to event synchronizing for fast response demanding application: labeling, nick\_finder, on fly cut., etc ...;
- Multi Axis movements synchronization capability;
- On fly change among any motion module's control modes;
- On fly electric gear enable/disable capability;
- Motor stall detection & target position tracking through encoder feedback.

#### Homing Motion Profiles

#### Mixed Motion Profiles

#### Multi Axis Synchronization

# SlimLine Series Drives

## SW1 Series

### Control modes:

- Step & Direction or Analog

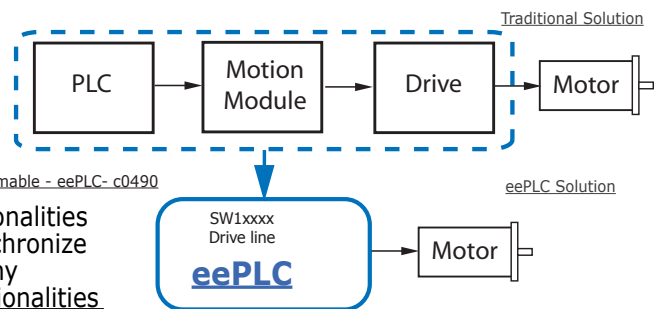

- Multi Axes Systems

Drives' control through commands by master controller. Suitable for multi axes systems (up to 127 drives). Built in powerful motion module functionality assures Perfect synchronization among axes and reduces master controller workload.

- Stand Alone Mode

eePLC integrates PLC, Motion Module, Process Module and drive in One Device. eePLC Studio PC interface is available to friendly, fast and easy custom to machine or process device's programmig.

Atomic handler permits user to access all the functionalities and resources of the device and to manage and synchronize the motion module and other drive's resources to any process' events. Access to all powerful motion functionalities built in process realtime modules for special applications:

- Labeling
- CAM
- Wire Processing
- User Custom Process

### Software:

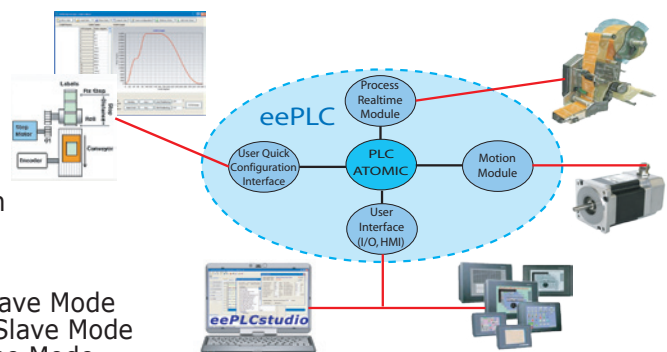

Special Quick Configuration Windows for Process Realtime Modules.

Accepts parameter setting from optional controller through serial RS232, RS422, RS485 in Modbus RTU protocol (HMI, PLC, PC, other).

Ever co. proprietary PC Software Tools for easy and quick development, configuration and supervision of each system.

- PC Software Tools available:
- SL\_Modbus for Modbus Slave Mode
  - SL\_CAN for CANopen Slave Mode
  - SL\_eePLC for Stand Alone Mode

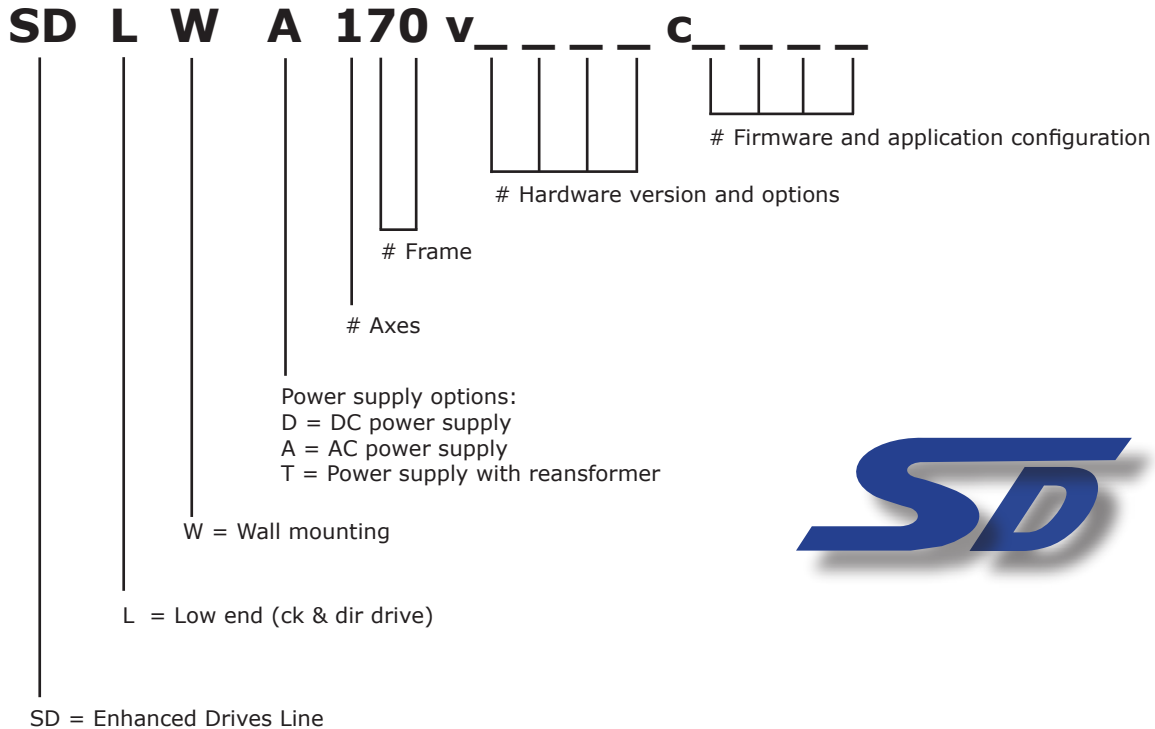

Realtime process special software modules availables:  
- Labeling - CAM - Wire Processing - User Custom -

## SD Enhanced Series Drives

### ● SDL Series

#### Product Number Code for SD Enhanced Line Drives

### Main features:

The SDLWx170 / 180 is a step motor 'clock & direction' driver implemented through a new generation of DSPC. The unit integrates a microstep drive able to move the motor according to the input digital signals issued by an external master controller. Dip-switches are available to user settings. The unit is powered through one AC or DC bus and can drive the stepper motor in open velocity & position loops, according to internal or external acceleration and deceleration ramps, while running a real time checking of the critical working parameters as temperature rise, voltages and currents.

All model features:

- On Board Safety provisions:
  - ✓ fully tested for direct installation unit
  - ✓ fault monitoring and handling
  - ✓ on field working errors buffering
  
- Other features:
 

✓ low motor vibration	✓ compact sizes
✓ low mech. noise	✓ low heat generation
✓ no resonance	✓ high reliability
✓ safe protections	✓ high speed and torque output
✓ DC/AC Power Supply	✓ wide range of power

## SD Enhanced Series Drives

### ● SDL Series

#### Models specifications:

#### **SDLWD170 / SDLWA170**

- supply voltage from 24 to 130 Vdc (SDLWD170) or from 24 to 90 Vac (SDLWA170);
- phase current from 1.0 to 8.0 Arms;
- step angle from full step to 1/256 with sinusoidal envelopes;
- 4 200kHz, 5V line-driver or 24Vdc PNP or NPN optoisolated inputs for clock, direction, enable and current boosting;
- 1 24Vdc-500mA fault and busy protected output;
- automatic reduction of the idle current;
- dimensions 100.0 x 74.0 x 37.0 mm.

#### **SDLWD180 / SDLWA180 / SDLWT180**

- supply voltage from 24 to 70 Vdc (SDLWD180) or from 24 to 48 Vac (SDLWA180) or 115/220 Vac (SDLWT180);
- phase current from 0.5 to 5.0 Arms;
- step angle: full step to 1/256 sinusoidal envelopes;
- 4 200kHz, 5V line-driver or 24Vdc PNP or NPN optoisolated inputs for clock, direction, enable and current boosting;
- 1 24Vdc-500mA fault and busy protected output;
- automatic reduction of the idle current;
- dimensions 123.3 x 175.0 x 47.7 (88.3 for SDLWA170) mm.

#### Control modes:

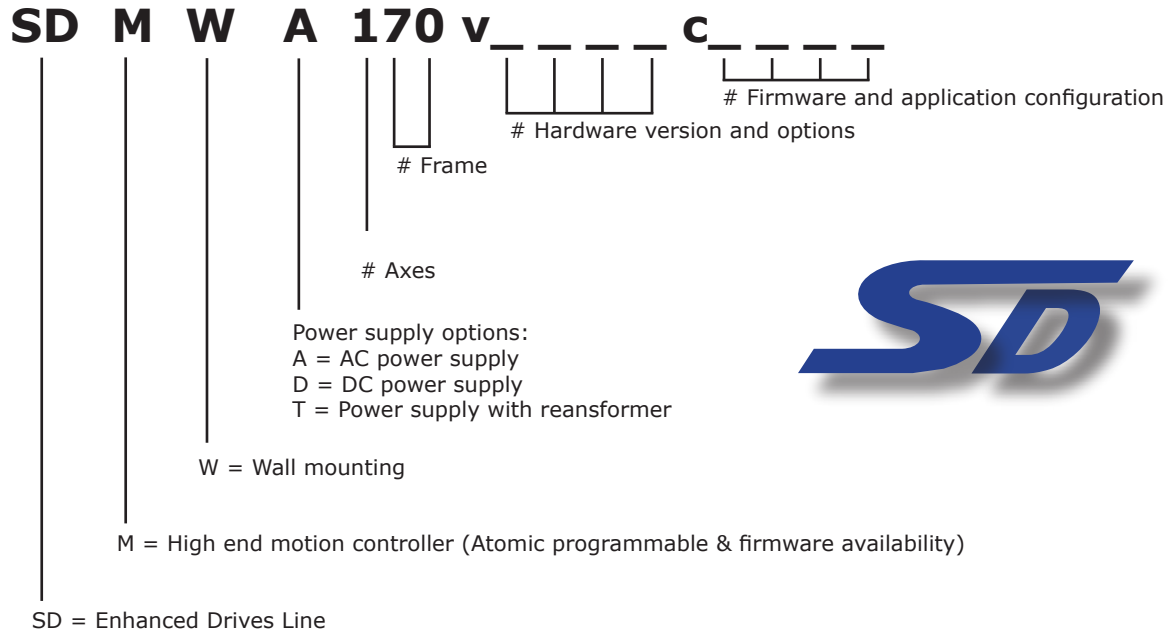

- Step & Direction Mode

## SD Enhanced Series Drives

- SDM Series

### Product Number Code for SD Enhanced Line Drives

### Main features:

The SDMwx170 / SDMwx180 / SDMWA130 module are a compact step motor drive that integrates a microstep drives and a logic able to move the motor following commands mastered by a PLC through a CANbus or a RS232/485 link. These units can work also in stand alone modality with customized firmware for general common applications or programmed with ATOMIC software. These units are powered through one AC or DC bus and can drive the stepper motor in open or closed velocity & position loops, according to internal or external acceleration and deceleration ramps, while running a real time checking of the critical working parameters as temperature rise, voltages and currents. All models features:

- Multiform Control Modes
- On Board Safety provisions:
  - ✓ fully tested for direct installation unit
  - ✓ built in watch dog functionality
  - ✓ fault monitoring and handling
  - ✓ on field working errors buffering
- Other features:
 

✓ low motor vibration	✓ compact sizes
✓ low mech. noise	✓ low heat generation
✓ no resonance	✓ high reliability
✓ safe protections	✓ high speed and torque output
✓ DC/AC Power Supply	✓ wide range of power

# SD Enhanced Series Drives

## ● SDM Series

### Specifications

#### SDMWD170 / SDMWA170

- supply voltage from 24 to 130 Vdc (SDMWD170) or from 24 to 90 Vac (SDMWA170);
- phase current from 1.0 to 8.0 Arms;
- step angle from full step to 1/256 with sinusoidal envelopes;
- 4 200kHz, 5V line-driver or 24Vdc PNP or NPN optoisolated inputs
- 1  $\pm 10$ Vdc analog input;
- 4 24Vdc-500mA optocoupled and protected outputs;
- CANbus (Canopen) or serial RS232/RS485 (Modbus) interface;
- 7 segment led display monitoring of the working status;
- dimensions 123.3 x 175.0 x 47.7 (88.3 for SDMWA170) mm.

#### SDMWD180 / SDLWA180 / SDMWT180 / SDMWA130

- supply voltage from 24 to 70 Vdc (SDMWD180) or from 24 to 48 Vac (SDMWA180/SDMWA130) or 115/220 Vac (SDMWT180);
- phase current from 0.5 to 5.0 Arms;
- step angle from full step to 1/256 with sinusoidal envelopes;
- 4 200kHz, 5V line-driver or 24Vdc PNP or NPN optoisolated inputs
- 2  $\pm 10$ Vdc analog inputs;
- 3 24Vdc-500mA optocoupled and protected outputs;
- CANbus (Canopen) or serial RS232/RS485 (Modbus) interface;
- 7 segment led display monitoring of the working status
- dimensions 123.3 x 175.0 x 47.7 (118.6 for SDMWT180) mm.

#### SDMWA130

- supply voltage from 24 to 70 Vdc (SDMWD180) or from 24 to 48 Vac (SDMWA180/SDMWA130) or 115/220 Vac (SDMWT180);
- phase current from 0.5 to 5.0 Arms;
- step angle: full step to 1/256 with sinusoidal envelopes;
- 4 200kHz, 5V line-driver or 24Vdc PNP or NPN optoisolated inputs;
- 2  $\pm 10$ Vdc analog inputs;
- 3 24Vdc-500mA optocoupled and protected outputs;
- CANbus (Canopen) or serial RS232/RS485 (Modbus) interface;
- dimensions 86.0 x 165.0 x 45.0 mm.

### Motion module:

- Step & Direction control mode;
- Analog speed ref. control mode (by potentiometer or  $\pm 10$ Vdc);
- Velocity control mode;
- Wide range of positioning control modes (homing, relative, absolute, target);
- CAM mode: cam profile can be programmed;
- Electric Gear with programmable gear ratio to track external master reference (from fieldbus or incremental encoder) of motor's speed and position;
- High speed I/O triggered motor's start & stop to event synchronizing for fast response demanding application: labeling, nick\_finder, on fly cut., etc ...;
- Multi Axis movements synchronization capability;
- On fly change among any motion module's control modes;
- On fly electric gear enable/disable capability;
- Motor stall detection & target position tracking through encoder feedback.

#### Homing Motion Profiles

#### Mixed Motion Profiles

#### Multi Axis Synchronization

# SD Enhanced Series Drives

## SDM Series

### Control modes:

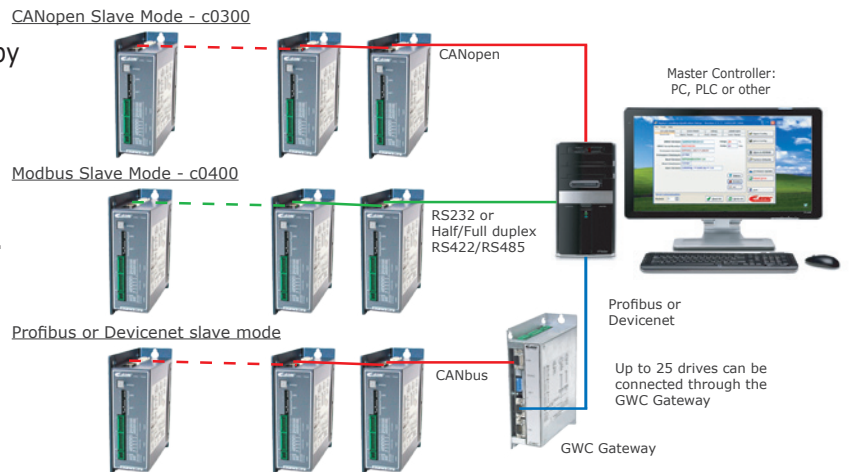

- Step & Direction or Analog

- Multi Axes Systems

Drives' control through commands by Master Controller. Suitable for multi axes systems (up to 127 drives).

Built in Powerfull Motion Module functionality assures Perfect synchronization among axes and reduces Master Controller workload.

- Stand Alone Mode

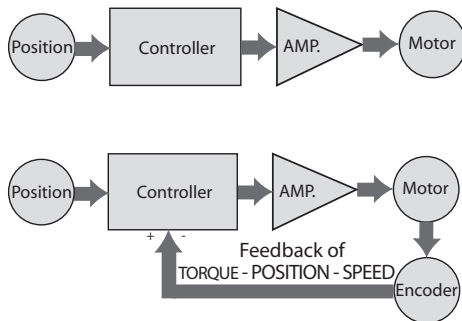

The drive can be programmed and configured also for stand alone operations.

Please see the firmware/software applications available for this function.

## Open loop / Closed loop

### Advantages of Closed Loop Control:

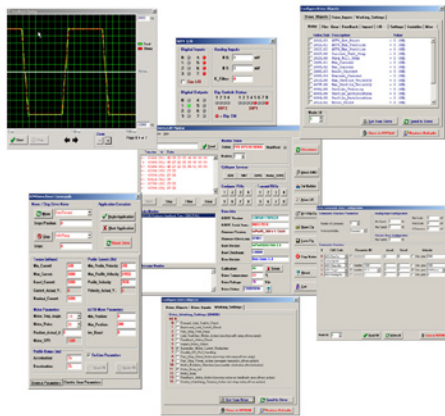

- *with regard to an open loop stepper solution:*
  - Reliable positioning without synchronism loss;
  - Keeps the original position stable and recovers it automatically in case of positioning errors caused by external factors such as mechanical vibrations;
  - 100% use of the motor torque;
  - Capacity to operate at high velocity related to the current control, which is adjusted depending on the load variations, where the normal systems in open loop use a constant current control at all velocities without considering the load variations.
- *compared with a brushless servo controlled solution:*
  - no need to adjust the power (automatic current regulation depending on the load changes);
  - Keeping the position stable without fluctuations after completing the positioning;
  - Quick positioning favoured by the independent control of the integrated DSP;
  - Allows the continuous and fast execution of short stroke movements thanks to the short positioning time.

# SD Enhanced Series Drives

## ● SDM Series

### Softwares:

Ever Eletttronica PC Software tools to develop, configure and monitor every system in an easy and fast way.:

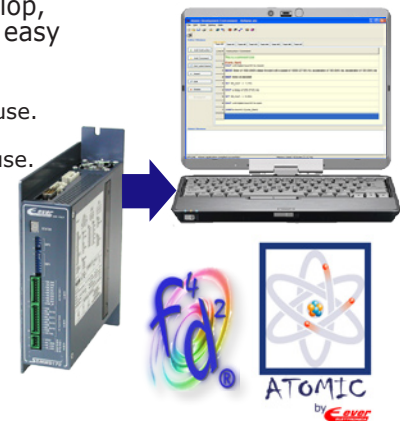

SDM\_CAN = to configure the drive for CANbus use.

SDM\_MOD = to configure the drive for Modbus use.

SDM\_LBL = to configure the drive for the management of a labelling head.

SDM\_TRK = to configure the drive for a 'Digital Tracker' function.

ATOMIC = environment for the simple and fast programming of customized cycles.

Accepts configuration parameters of optional controllers by means of CANbus connections with Canopen protocol or Serial RS232, RS422, RS485 with MODbus RTU protocols (HMI, PLC, PC, other...).

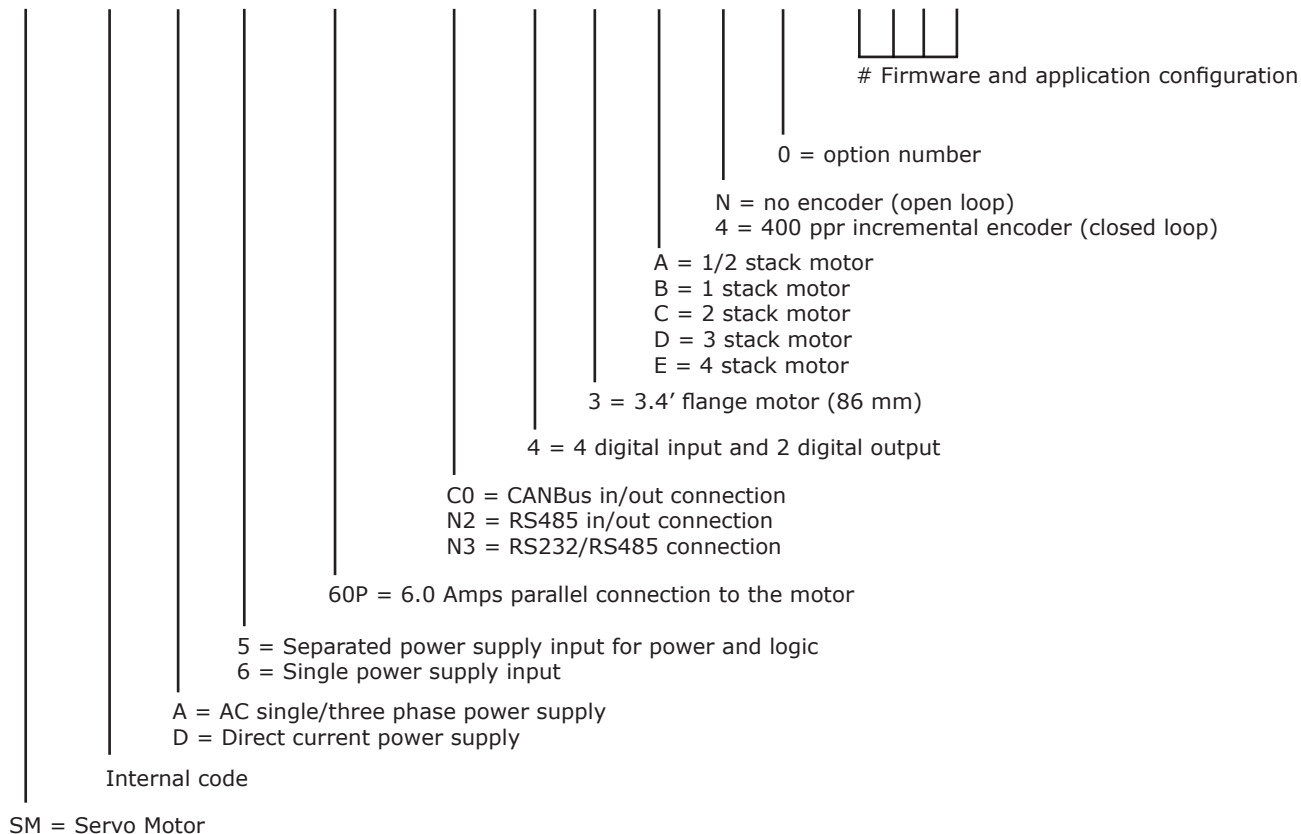

- **CANBus std applications:** *generic application for motor operation via CANopen control commands (c0300).*  
This firmware application is supplied as standard on all SDM drives with CANbus interface to enable the drive to execute motion control commands mastered by a control unit according to CanOpen protocol. The CANbus interface offers numerous advantages: reliability, easy-to-wire and low costs as well as being programmer-friendly and with highly efficient communication.
- **ModBus std applications:** *generic application for motor operation via Modbus control commands (c0400).*  
Implemented on all SDM drives provided with a serial RS232/485 interface, this firmware application allows the drive control by a master unit according to the Modbus RTU protocol.
- **Labelling control:** *'stand alone' application for high performance labelling control (c0404 / c0450).*  
The labelling machine control firmware is available in two versions, 'Silver' and 'Gold XP', running on all SDM with serial RS232/RS485 interface. High performance, easy set-up and maintenance and user-friendly automatic labels format changeover functions are just a few of the main characteristics of the 'Silver' version. Further important functions that have been introduced in the 'Gold XP' versions for an even more comprehensive, high performance and clever functionality of the labelling machine are for instance:
  - missing label handling: detecting the label missing in the roll the machine can recover the right labels line positioning before the arrival of the next item to label;
  - multi-label: the same item can be labelled in several precise and distinct positions;
  - closed loop: this mode can be enabled by installing a feedback shaft encoder on the motor driving the labels roll for a further improvement of labels positioning speed and precision.
- **Digital Tracker:** *motor operation with step-direction-drive enable or analog voltage controls (c0420).*  
This application firmware allows SDM drives to receive movement commands via the traditional digital signals of step, direction, drive enable and current reduction or boosting or via analog reference voltages of torque, speed and position. The drive will automatically calculate the resulting motion profile and the relevant acceleration and deceleration ramps in accordance with the movement parameters set in open or closed loop featuring all the performance advantages provided by Ever Eletttronica's f<sup>4</sup>d<sup>2</sup> technology.
- **Thread winding:** *'stand alone' application for accurate thread winding (c0370).*  
This firmware can be implemented on all drives with a CANbus or serial interface to manage the winding of a thread reel according to the most common winding methods: 'wild' crossing, 'precision' crossing, 'precision step' crossing. Furthermore, this firmware permits an accurate control of the reel 'tapering' and 'borders hiding' through dedicated regulating parameters set-up, whereas for any type of thread winding it is possible to define the winding ratio, the threads crossing mode, etc. The drive can receive synchronisation commands from a master PLC and calculate the motion profiles of the step motor controlled in closed loop to obtain very fast winding performances.
- **ATOMIC:** *the software environment to program SDM drives (c0499).*  
Atomic is a micro programming language designed for the 'full digital' SDM family drives. The scope of this language is to give the user the freedom to create his own simple application without having to switch to more complex and more expensive drives. Atomic's philosophy is to have few but powerful instructions. The Atomic software development environment is a Microsoft Windows (tm) application that enables to build the user application by means of wizards and dialog boxes so it will not be necessary to write a single line of instruction. This means that the user doesn't have to learn the syntax of the Atomic instructions that are completely handled by the Personal Computer software.

# Integrated Servomotors

## ● SM2A Series

### Product number code for SlimLine integrated servomotors

**SM 2 A 6 60P C0 4 3 B 4 0 c0300**

### Main features:

The SM2A series with a flange size of 86 mm have IP65 protection degree, high reliability connectors, AC power supply, protection against over-and under-voltage, over-current, open phase and overheating of the drive, fieldbus and I/O's. The motors, made of Low Power Loss materials, feature a holding torque from 3.4 to 12.5 Nm and a feedback encoder for the closed loop control of torque, velocity and position.

All models performs:

- Multifunction Control Modes
- On Board Safety provisions:
  - ✓ fully tested for direct installation unit
  - ✓ built in watch dog functionality
  - ✓ fault monitoring and handling
  - ✓ on field working errors buffering
  - ✓ separated power supply for logic and power
- Servomotors main features:
  - ✓ low motor vibration
  - ✓ low mechanical noise
  - ✓ low heat production
  - ✓ AC power supply
  - ✓ closed loop of torque, velocity and position
  - ✓ protection class IP65
  - ✓ no resonance
  - ✓ high reliability
  - ✓ wide range of power

# Integrated Servomotors

## ● SM2A Series

### Specifications:

Code		Holding Torque
SM2A	A	3.40 Nm ±10%
SM2A	B	4.50 Nm ±10%
SM2A	C	7.00 Nm ±10%
SM2A	D	8.50 Nm ±10%
SM2A	E	12.00 Nm ±10%

- separated power supply 24 V<sub>DC</sub> (logic) and 24÷100 V<sub>AC</sub> (power) for SM2A5 models and single single 24÷100 V<sub>AC</sub> for SM2A6 models;
- output phase current up to 8.0 A<sub>RMS</sub> (11.0 A<sub>PEAK</sub>);
- H-bridge bipolar chopper of 40 KHz power stage
- RS232 / RS422 / RS485 or CANbus optoisolated control interfaces;
- 4 digital optocoupled inputs and 2 digital optocoupled outputs (100 mA);
- 2 analog inputs (potentiometer or ±10Vdc);
- step resolution from full step to 128 microstep (open loop) or StepLess technology (closed loop);
- Over/Under-voltage, Over Current, Over Temperature, Open Windings, Closed Windings Phase/Phase Phase/Ground safety protections;
- IP65 protection class;
- dimensions:

Models	Length	Dimensions (mm)		
		Shaft Ø	Key	Shaft + Key

# GWC Controller, TRIPOS GW Software and Applications

## ● GWC Motion Controller, Gateway & PLC

### Main features:

The GWC unit provides three main functionalities: motion controller, gateway and programmable logic controller (PLC). As PLC and motion controller it permits the user to locally controll a process through fieldbus, serial links and I/Os and executing an user defined program. Working as bus gateway it allows the data exchanging among different automation field busses: CANBus (CANOpen), DeviceNet, ProfiBus, ModeBus working. The three functionalities, built in the same unit, allow an easy solution to a spread range of industry automation processes.

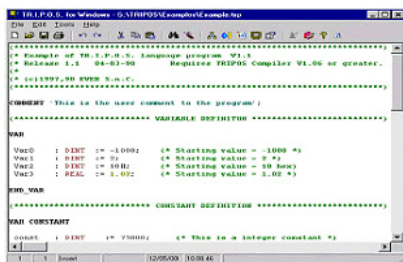

### Specifications

#### GWCB211

- power supply 24 Vdc - 800 mA max;
- CPU 16 bit 40 Mhz CISC;
- user program memory 1 Mb flash and 512 Kb high speed ram;
- CanOpen interfaces electrically isolated, 1Mbit/s;
- CanOpen or DeviceNet electrically isolated, 1Mbit/s;
- profibus-DP interface electrically isolated;
- 2 serial interfaces RS232/RS485 electrically isolated;
- 8 electrically isolated 5 ÷ 24Vdc - 200 kHz inputs;
- 8 electrically isolated 24V - 0.5A- 1kHz outputs;
- 8 dip-switches for user functions setting;
- 7 segment leds display of the unit status;
- dimensions 194.0 x 120.0 x 45.0 mm.

### The software environment to program the GWC controller

The programming environment T.R.I.P.O.S. GW allows the user to create its own cycle by means of a structured language in accordance with the IEC1131-E(ST) standards. T.R.I.P.O.S. GW allows a wide access to hardware resources through the GWC device and is open to the extensions of the user functions with protection.

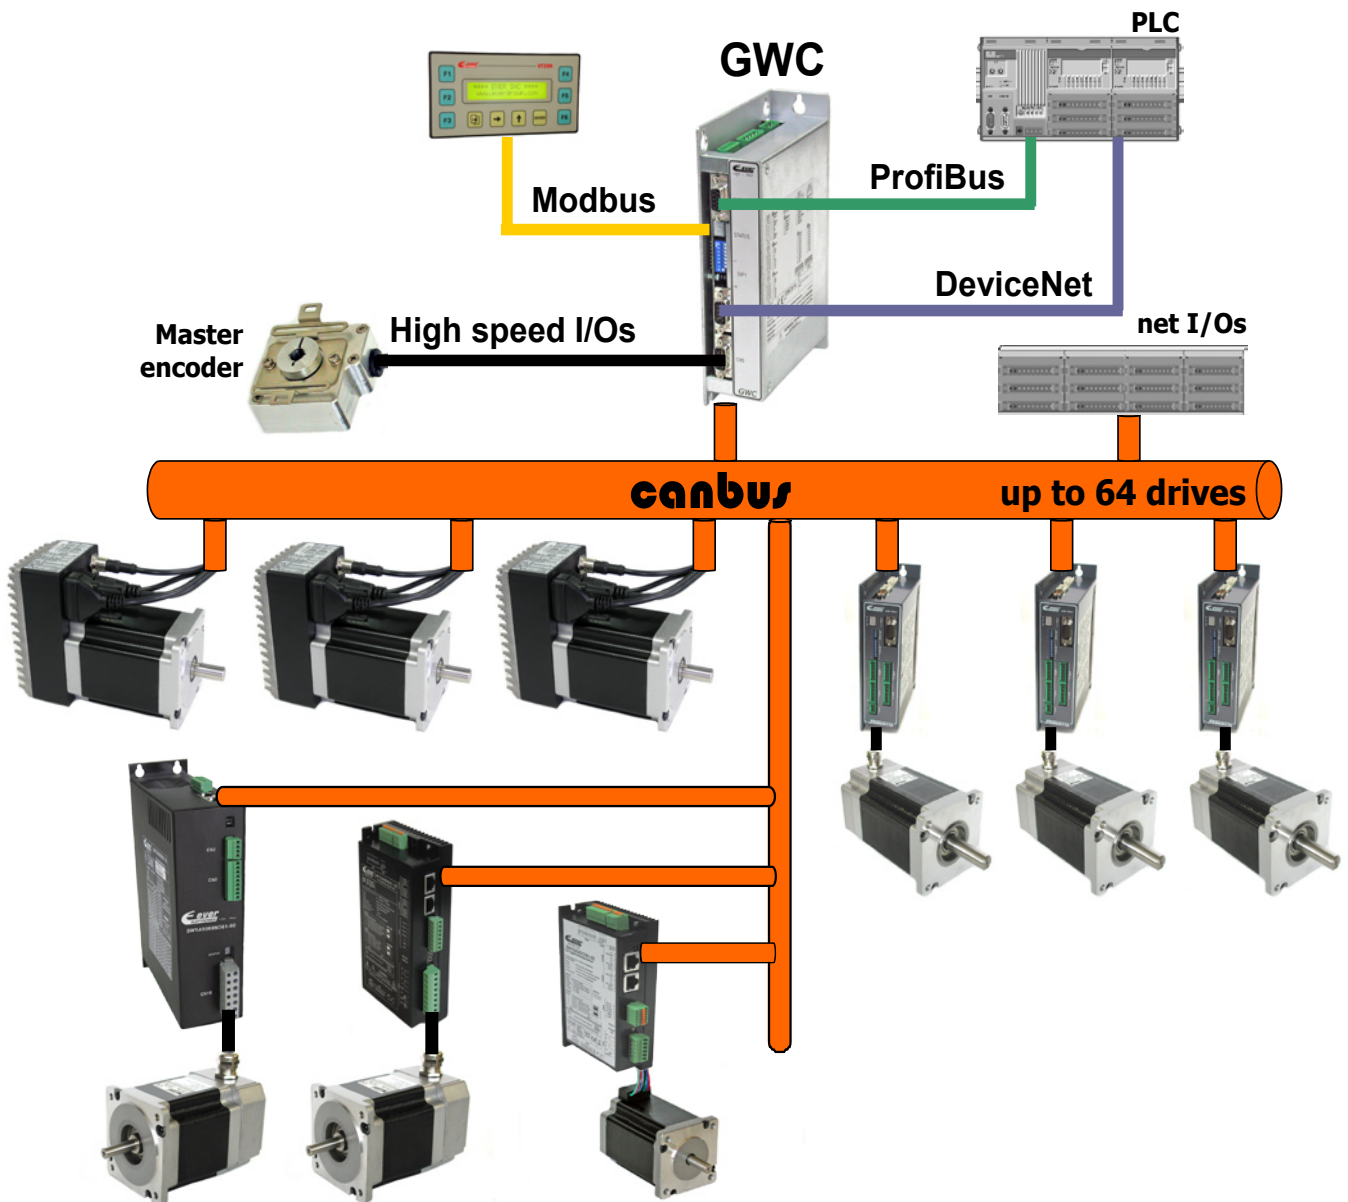

T.R.I.P.O.S.GW environment permits the full editing of the program and of all its functions, which can be easily personalized to adapt to every type of machine. Allows to personalize the cam to memorize into the GWC unit or to import other cams realized with other motion control devices
