# GAS/SG-ST - backlash free jaw coupling «in steel»: introduction

- Made in steel fully turned with standard phosphating treatment.
- Several elastomer hardnesses available (see page 27).
- High torsional rigidity.
- Electric insulation between the parts.
- Statically balanced.
- Version with integrated locking assemblies (GAS/SG/CCE page 29).

**ON REQUEST**

- Conformity to directive ATEX possible.
- Specific surface treatments or fully stainless steel version (GAS-SS).
- Customised manufacturing for specific requirements.
- Connection to the Torque limiter's (safety coupling) range possible.

The coupling GAS/SG is an elastomeric coupling with compact dimensions composed of two hubs made in steel UNI EN ISO 683-1:2018, fully turned and one elastomeric element.

The hub's tooth profile is designed to allow the elastomeric element to work only by compression and not in shear, allowing for a longer life of the coupling in high reversal or load applications.

The presence of the elastomer assures:

- the possibility to absorb collisions and vibrations;
- to compensate for unavoidable misalignments between the shafts;
- silence during transmission.

The basic series of GAS/SG is composed of different details that can be assembled together in order to get the right configuration for the application:

- **Hub 1 (M1):** hub base for any type of connection
- **Long hub 1 (M1L):** extended hub for connecting long shafts
- **Hub 2 (M2) :** hub with external diameter lowered for assembly in confined spaces

Hub M1

Hub M1L

Hub M2

## DESCRIPTION OF THE ELASTOMERIC ELEMENT

The fundamental item of this coupling is the elastomeric element or elastomer, made in polyurethane and available in several hardness grades, for different uses and applications. The elastomer is manufactured to resist ageing, scoring, fatigue, hydrolysis and UV radiations, promoting longer life operation. It also resists main chemical agents, like ozone, oils, grease and hydrocarbons.

The elastomeric element becomes prestressed during the assembly between the relevant hub's teeth, in order to be able to transmit the motion without backlash, so torsionally rigid inside the prestressing load. The prestressed elastomer's surface is sufficiently wide to induce a low contact pressure on the tooth of the same elastomer, reducing permanent deformations and promoting a long life.

## ATEX CONFORMITY

The GAS/SG coupling can be supplied in accordance to directive 2014/34/UE ATEX, which is relevant to protection apparatus and systems for use in potentially explosive spaces.

The dimensions of this coupling's version are not different from the standard version.

A mark relevant to the coupling's performances is printed on the hubs. It is necessary to consider planned tests, like those in the use and maintenance manual supplied together with each ATEX coupling.

The elastomeric elements used can be:

- yellow elastic element in polyurethane, 92 Shore-A : II 2 G D c T5 -20≤Ta≤+80°C X U
- red elastic element in polyurethane, 98 Shore-A : II 2 G D c T6 -20≤Ta≤+60°C X U
- green elastic element in polyurethane, 64 Shore-D : II 2 G D c T6 -20≤Ta≤+80°C X U

# GAS/SG-ST - backlash free jaw coupling «in steel»: introduction

## SG ELASTIC ELEMENT: PHYSICAL CHARACTERISTICS

Hardness	Material	Spider	Allowed temperature [°C]		Uses
			working	max (for short period)	
92 Sh-A	Polyurethane		-40 ÷ +90	-50 ÷ +120	- low and medium power - measurement and control system - common electric motors
98 Sh-A	Polyurethane		-30 ÷ +90	-40 ÷ +120	- high transmission torque - actuators, screwjacks - servomotors, right angle gearboxes
64 Sh-D	Polyurethane		-20 ÷ +110	-30 ÷ +120	- high torsional rigidity - machining centres - internal combustion motors

▲ On request different materials and hardnesses for specific applications

## NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.

# GAS/SG-AL - backlash free jaw coupling «in aluminium»: technical data

- Made in aluminum fully turned.
- High torsional rigidity.
- Elastomer available in different hardness (see page 27).
- Weight and inertia reduced.
- Electrical insulation between the parties.
- Statically balanced.

### ON REQUEST

- Single split clamp hub with H7 bore and keyway (type B1).
- Two piece clamp hub with H7 bore and keyway (type C1)
- Conformity to Directive ATEX possible.
- Customised manufacturing for specific requirements.

### NOTES

- ◆ Clamps hub type C and C1 on size 01, 02, 03, 04 machined on long hub M1L (dimension N1, change also total length R)
- Clamps hub type B and B1 on size 01, 02, 03, 04 machined with a single axial cut
- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.

# GAS/SG/DBSE-AL - backlash free jaw coupling with spacer «in aluminium»: technical data

- Made of aluminum fully turned.
- Elastomer available in different hardness (see page 27).
- Simple mounting thanks to the two piece clamp hub (type C).
- Radial assembly without removing the parts.
- Electrical insulation between the parts.
- Spacer with DBSE custom made.

### ON REQUEST

- Two piece clamp hub with keyway (C1).
- Various hub connection types available.
- Conformity to Directive ATEX possible.
- Dynamic balancing up to Q=2.5.

### PERMITTED SPEEDS

▲ on request

### NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.
- **For high speed and/or distance to be connected, consult our technical department to evaluate the best connection solution (single spacer or split with central support, page 37)**
- In case of vertical assembly, please contact our technical department.

## GAS-ST - jaw coupling «in steel»: introduction

- Made in steel fully turned with standard phosphating treatment.
- Several elastomer hardnesses available (see page 33).
- High compensation of misalignments.
- Vibration dampening.
- Statically balanced.
- Modularity of the components, with different assembly versions.

### ON REQUEST

- Conformity to ATEX directive possible.
- Specific treatments or version fully in stainless steel.
- Manufacturing made to length and customizations for specific needs.
- Connection to the Torque limiter's (safety coupling) range possible.

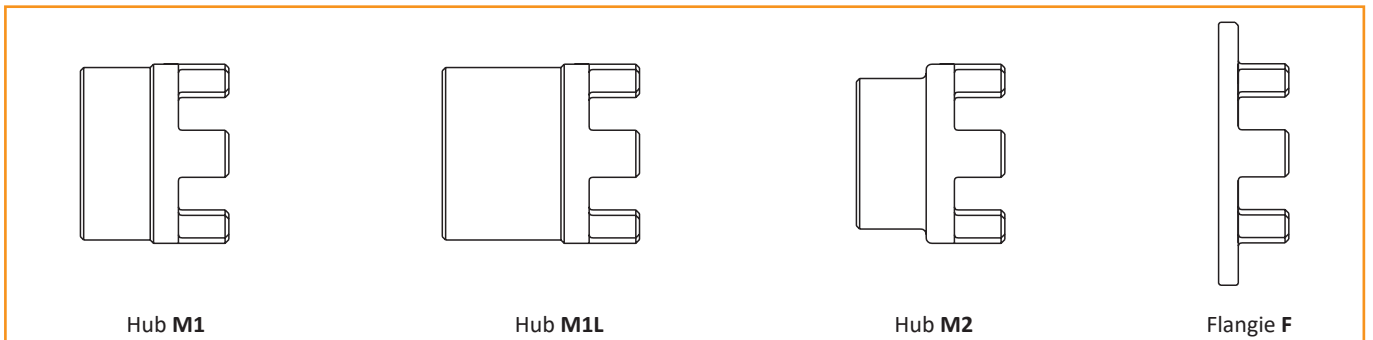

The coupling GAS/SG is an elastomeric coupling with compact dimensions composed of two hubs made in steel UNI EN ISO 683-1:2018, fully turned with one elastomer.

The hub's tooth profile is designed to allow the elastomeric element to work only by compression and not in shear, allowing for long life of the coupling in high reversal or load applications.

The GAS base series are available in several hub versions to allow an assembly to suit the application.

- **Hub 1 (M1)** : base hub for any kind of connection.
- **Long hub 1 (M1L)** : extended hub to connect long shafts.
- **Hub 2 (M2)** : hub with reduced external diameter for assembly in compact spaces.
- **Flangie (F)** : flange for connection shaft-flange.

Hub M1

Hub M1L

Hub M2

Flangie F

### DESCRIPTION OF THE ELASTOMERIC ELEMENT

The fundamental item of this coupling is the elastomeric element, made in different grades of hardness for different needs and applications. The elastomer is manufactured from elements to resist ageing, scoring, fatigue, hydrolysis and UV radiations, promoting long life operation and resisting main chemical agents, like ozone, oils, greases and hydrocarbons.

### ATEX CONFORMITY

The GAS coupling can be supplied in accordance to directive 2014/34/UE (ATEX), which is relevant to protection apparatus and systems for use in potentially explosive spaces.

The dimensions of this coupling's version are not different from the standard version.

A mark relevant to the coupling's performances is printed on the hubs. It is necessary to consider planned tests, as described in the use and maintenance manual supplied together with each ATEX coupling.

The elastomeric elements used can be:

- yellow elastic element in polyurethane, 92 Shore-A : II 2 G D c T5 -20≤Ta≤+80°C X U
- green elastic element in polyurethane, 64 Shore-D : II 2 G D c T6 -20≤Ta≤+80°C X U

# GAS-ST - jaw coupling «in steel»: introduction

## ELASTIC ELEMENT: PHYSICAL CHARACTERISTICS

Hardness	Material	Spider	Allowed temperature [°C]		Users
			working	max (for short periods)	
92 Sh-A	Polyurethane		-40 ÷ +90	-50 ÷ +120	- low and medium power - systems with frequent starts
95 Sh-A 98 Sh-A	Thermoplastic		-40 ÷ +90	-50 ÷ +110	- high transmission torque - high temperature range
64 Sh-D	Polyurethane		-20 ÷ +110	-30 ÷ +120	- high torsional rigidity - Internal combustion motors

▲ On request different materials and hardnesses for specific applications

### NOTES

- The weights refer to the coupling with minimum bore.
- Inertias refer to the coupling with maximum bore.
- For choice and availability of different hub connection type see pages 4 and 5.

## GAS/SG: APPLICATION EXAMPLE

## DIMENSIONING

For pre-selection of the coupling's size you can use the generic formula indicated on page 6.

Having established the coupling's size to be used, it is possible to make other checks considering further parameters:

$$C_{nom} > C_{mot} \cdot f_T \cdot f_R$$

Dove:

$C_{nom}$  = theoretic nominal torque of the coupling [Nm]

$C_{mot}$  = nominal torque motor side [Nm]

$C_{max}$  = maximum torque of the coupling [Nm]

$C_{SU}$  = static torque user side [Nm]

$C_{SM}$  = static torque motor side [Nm]

$f_A$  = starting frequency factor

$f_R$  = rigidity factor

$f_T$  = thermic factor

$J_{mot}$  = inertia motor side [Kgm<sup>2</sup>]

$J_{uti}$  = inertia user side [Kgm<sup>2</sup>]

$K$  = shock factor

$$C_{max} = C_{SM} \cdot \frac{J_{uti}}{J_{mot} + J_{uti}} \cdot K \cdot f_T \cdot f_A + C_{mot} \cdot f_T \cdot f_R$$

$$C_{nom} = C_{SU} \cdot \frac{J_{uti}}{J_{mot} + J_{uti}} \cdot K \cdot f_T \cdot f_A + C_{mot} \cdot f_T \cdot f_R$$

$$C_{nom} > \frac{1}{M} \cdot C_{alt} \cdot f_F \cdot f_T \cdot f_R$$

Dove:

$C_{alt}$  = alternate system torque [Nm]

$C_{nom}$  = theoretic nominal torque of the coupling [Nm]

$f_F$  = resonance factor

$f_R$  = rigidity factor

$f_T$  = thermic factor

$M$  = coefficient of material

Coefficient of material (M)

0,25 = aluminium

0,35 = steel

Resonance factor ( $f_F$ )

1 = frequency < 10

$\sqrt{f/10}$  = frequency > 10

Rigidity factor ( $f_R$ )

2÷5 = positioning system

3÷8 = tool machines

>10 = turn indicator

Shock factor (K)

1 = light shock

1,4 = medium shock

1,8 = hard shock

Thermic factor ( $f_T$ )

1 = -30 ÷ +30 °C

1,2 = +40 °C

1,4 = +60 °C

1,8 = +80 °C

Starting frequency factor ( $f_A$ )

1 = 0 ÷ 100 starting each hour

1,2 = > 100 ÷ 200 " "

1,4 = > 200 ÷ 400 " "

1,6 = > 400 ÷ 800 " "

1,8 = > 800 ÷ 1600 " "

Completed and verified the choice of the coupling respect the torque to be transmitted, it is necessary to consider the flexibility, comparing the misalignment allowed by the type of coupling chosen with the real ones provided by the shafts to be connected. If simultaneously present at all types of misalignment, it is necessary that the sum as a percentage of the maximum value does not exceed 100%, according to the graphic 1.

1. Allowed ratio between misalignments [%]

## GAS/SG/DBSE - AL: APPLICATION EXAMPLE

In case of a long DBSE combined with high speed, it would be necessary to use an intermediate shaft with support and bearing. Please consult our Technical Department.

Plummer block housing units		
GAS/SG/DBSE	Type	Shaft
01	UCP 202	d=15
00	UCP 204	d=20
0	UCP 205	d=25
1	UCP 206	d=30
2	UCP 208	d=40
3	UCP 209	d=45
4	UCP 210	d=50

The model with a central spacer "GAS / SG / DBSE-AL", in addition to being essential for connecting transmission drives spaced apart. Is able (unlike the classic model GAS/SG) to recover, as needed, up to twice the angular misalignment (picture 2) and axial (picture 3) or a high radial misalignment (picture 1) according to the formula:

$$K = [L_{tot} - (2 \cdot N) - P] \cdot \text{Tg } \alpha$$

Where:

K = radial misalignment [mm]

$L_{tot}$  = total length of GAS/DBSE coupling [mm]

N = useful length of an half-hub [mm]

P = useful space of the elastomeric element [mm]

$\alpha$  = angular misalignment [°]

It is possible to determine also the positioning error by the torsion angle according to the formula:

$$\beta = \frac{180 \cdot C_{mot}}{\pi \cdot R_{TOT}}$$

Where:

$\beta$  = torsion angle [°]

$C_{mot}$  = maximum torque motor side [Nm]

$R_{TOT}$  = total torsional rigidity of the coupling [Nm/rad]

In case of GAS/SG/DBSE-AL the total torsional rigidity of the coupling is expressed by the formula:

$$R_{TOT} = \frac{1}{\left(\frac{2}{R_T} + \frac{L_i}{R_{rel}}\right)}$$

Where:

$R_{TOT}$  = total torsional rigidity [Nm/rad]

$R_T$  = torsional rigidity of spider [Nm/rad]

$R_{rel}$  = torsional rigidity of spacer [Nm/rad]

$L_i$  = spacer length (=DBSE-2Y) [m]

# GAS/SG & GAS - jaw coupling: additional information

## FITTING

This coupling does not require particular procedures for assembly. It can be assembled both vertically and horizontally.

- 1) Achieve radial and axial alignments as precisely as possible, in order to have maximum absorption of possible misalignments and life of the coupling.
- 2) Assemble the two half-hubs on the shafts. Check that the external parts of the two shafts do not exceed the relevant half-hub's surface (quote "N") and fix this one to the shaft with its relevant fixing system.
- 3) Assemble the elastomeric element on one half-hub and close the other inserting the relevant teeth into the elastomeric element, being careful to respect the distance of the two half-hubs indicated on the catalogue, quote "P".

In case of connection by clamp locking or locking assemblies, tighten the relevant screws progressively up to the tightening torque indicated in the catalogue, using a cross sequence.

NOTES

• For the choice of the coupling, is considered a safety factor of 1,5 on the nominal torque and an ambient temperature of 27 °C
